Please remove this sheet before starting your exam.

Things you must have memorized

The Momentum Principle	The Energy Principle	The Angular Momentum Principle		
Definition of Momentum	Definition of Velocity	Definition of Angular Momentum		
Definitions of angular velocity, particle energy, kinetic energy, and work				

Other potentially useful relationships and quantities

$$E_N = N\hbar\omega_0 + E_0$$
 where $N = 0, 1, 2...$ and $\omega_0 = \sqrt{\frac{k_{si}}{m_a}}$ (Quantized oscillator energy levels)

Moment of inertia for rotation about indicated axis

$$I = \frac{2}{5}MR^{2} \qquad I = \frac{1}{2}MR^{2} \qquad I = \frac{1}{12}ML^{2} \qquad I = \frac{1}{3}ML^{2} \qquad I = \frac{1}{12}ML^{2} + \frac{1}{4}MR^{2}$$

Constant	Symbol	Approximate Value	
Speed of light	c	$3 \times 10^8 \text{ m/s}$	
Gravitational constant	G	$6.7 \times 10^{-11} \text{ N} \cdot \text{m}^2/\text{kg}^2$	
Approx. grav field near Earth's surface	g	$9.8 \mathrm{\ N/kg}$	
Electron mass	m_e	$9 \times 10^{-31} \text{ kg}$	
Proton mass	m_p	$1.7 \times 10^{-27} \text{ kg}$	
Neutron mass	m_n	$1.7 \times 10^{-27} \text{ kg}$	
Electric constant	$\frac{1}{4\pi\epsilon_0}$	$9\times10^9~\mathrm{N}\cdot\mathrm{m}^2/\mathrm{C}^2$	
Proton charge	e	$1.6 \times 10^{-19} \text{ C}$	
Electron volt	1 eV	$1.6 \times 10^{-19} \text{ J}$	
Avogadro's number	N_A	$6.02 \times 10^{23} \text{ atoms/mol}$	
Plank's constant	h	6.6×10^{-34} joule · second	
$hbar = \frac{h}{2\pi}$	\hbar	1.05×10^{-34} joule · second	
specific heat capacity of water	C	$4.2 \mathrm{~J/g/K}$	
Boltzmann constant	k	$1.38 \times 10^{-23} \text{ J/K}$	

milli	m	1×10^{-3}	kilo	k	1×10^3
micro	μ	1×10^{-6}	mega	Μ	1×10^6
nano	\mathbf{n}	1×10^{-9}	giga	G	1×10^9
pico	p	1×10^{-12}	tera	\mathbf{T}	1×10^{12}

PHYS 2211 KMR - Test 2 - Spring 2022

Please clearly print your name & GTID in the lines below

Instructions

- This exam is closed internet/books/notes, except for the Formula Sheet which is included with the exam.
- You must work individually and receive no assistance from any person or resource.
- You are not allowed to post screenshots, files, or any other details of the test anywhere online, not even after the test is over.
- Work through all the problems first, then scan/upload your solutions after time is called.
 - Your uploaded files **must** be in either PNG, JPG, or PDF format.
 - Your uploaded files must be readable in order to be graded. Unreadable files will earn a zero.
 - You can upload a single file containing work for multiple problems as long as you upload the file for each problem individually.
 - Clearly label your work for each sub-part and box the final answers.
- To earn partial credit, your work must be legible and the organization must be clear.
 - Your solution should be worked out algebraically.
 - Numerical solutions should only be evaluated at the last step. Incorrect solutions that are not solved algebraically will receive an 80 percent deduction.
 - You must show all work, including correct vector notation.
 - Correct answers without adequate explanation will be counted wrong.
 - Incorrect work or explanations mixed in with correct work will be counted wrong. Cross out anything you do not want us to grade
 - Make explanations correct but brief. You do not need to write a lot of prose.
 - Include diagrams!
 - Show what goes into a calculation, not just the final number, e.g.: $\frac{a \cdot b}{c \cdot d} = \frac{(8 \times 10^{-3})(5 \times 10^6)}{(2 \times 10^{-5})(4 \times 10^4)} = 5 \times 10^4$
 - Give standard SI units with your numeric results. Your symbolic answers should not have units.

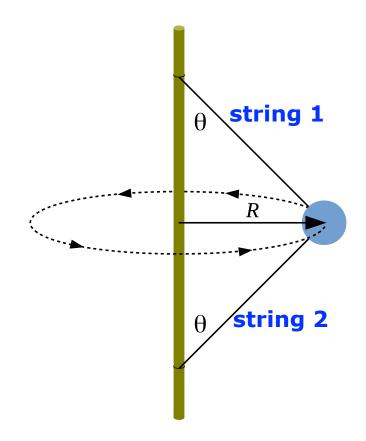

Unless specifically asked to derive a result, you may start from the formulas given on the formula sheet, including equations corresponding to the fundamental concepts. If a formula you need is not given, you must derive it.

If you cannot do some portion of a problem, invent a symbol for the quantity you can not calculate (explain that you are doing this), and use it to do the rest of the problem.

Consider the toy represented in the image to the right. This toy is made by attaching a ball of mass m to a wooden stick by means of two identical strings, each of which makes an angle θ with the stick. When you rotate the stick between the palms of your hands, the ball travels in a circle of radius R at constant speed v. In the diagram gravity points down, and the circular path of the ball is flat and in a plane that is parallel with the ground.

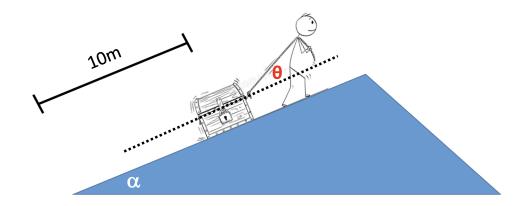

1. [10 pts] Draw a free-body diagram where the system is the ball at the location shown in the diagram. Your diagram should include all the forces acting on the ball in the correct directions and with correct angles, where applicable. Hint: think of what are the \hat{p} , \hat{n} , and \hat{y} axes in this problem.

Because the ball stays in a flat, horizontal plane, it inn't accelerating in the y-direction, and hence Sum of torces in the y-div = Efy = 0. (1) The ball undergoes a centripetal acceleration in the plane, sum of tones in the n-dir = $\Xi f_n = \frac{mv^2 \hat{n}}{R}$ (2) (There are no forces in the p-direction, It travels with constant speed in a circle,) Using Equation (1), re con relate Ti and Iz: ZF, 20 => Ticos &-Tross &-mg=0 $1\overline{T_1} = \overline{T_2} + \overline{mg}$ Using Equation (2), we can get another relation and solve for T_2 . $2f_1 = \frac{mv^2}{R} \hat{\Lambda}$ $= 7 \int_{1}^{\infty} \sin \theta + T_2 \sin \theta = \frac{mv^2}{R}$ $= 7 \left[T_2 + \frac{mg}{\cos \theta} \right] \sin \theta + T_2 \sin \theta = \frac{mv^2}{R}$

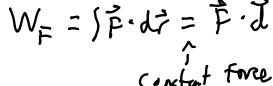

Treasure – Q3 in Gradescope [30 pts]

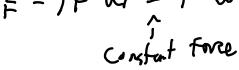

Stick Man is pulling his treasure chest up a hill that has an angle $\alpha = 30^{\circ}$. He pulls with a force $|\vec{F}| = 900 \text{ N}$ at an angle $\theta = 25^{\circ}$ with respect to the surface of the hill. The mass of the chest is m = 200 kg, and there's a coefficient of kinetic friction $\mu_k = 0.35$ between the chest and the hill.

Consider the **treasure chest alone** to be the system, and that it's moving up along the hill.

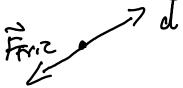

- 1. [3 pts] Is the work done by **gravity** positive, negative, or zero? Circle the correct answer.
 - positive
 - negative
 - zero

- 2. [3 pts] Is the work done by **friction** positive, negative, or zero? Circle the correct answer.
 - positive
 - negative
 - zero

- 3. [2 pts] Is the work done by the normal force positive, negative, or zero? Circle the correct answer.
 - positive
 - negative

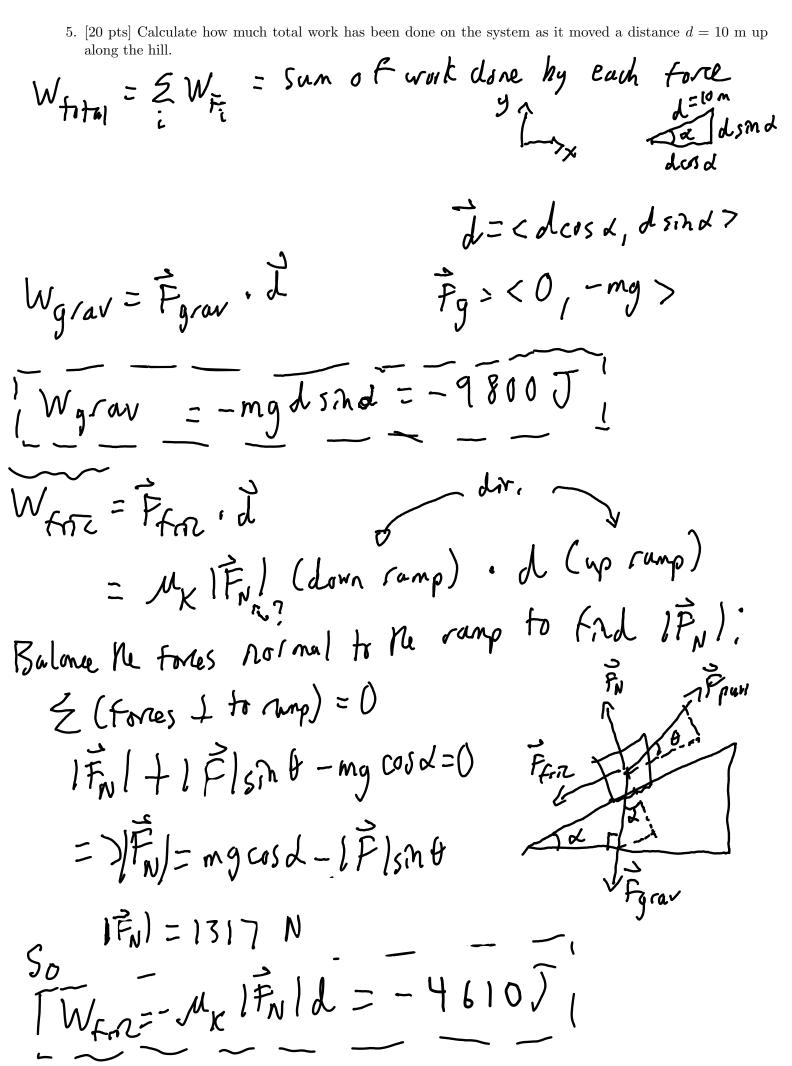

4. [2 pts] Is the work done by the pulling force positive, negative, or zero? Circle the correct answer.

- negative
- zero

This page is left blank if needed for extra work

Using coordinates along the ramp and I to the ramp; Fruit = < IFlost, IFISAD> up camp I to comp

Writar = sum of works = -4793 J

Energies – Q4 in Gradescope [30 pts]

Americium-241 is a radioactive isotope that is commonly found in smoke detectors. A nucleus of americium-241 at rest decays into a nucleus of neptunium-237 by emitting a fast-moving alpha particle and an x-ray photon:

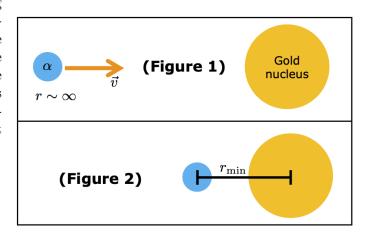

$$\mathrm{Am}^{241} \rightarrow \mathrm{Np}^{237} + \alpha$$
 particle + photon

Quantity	Variable		
mass of americium	m_A		
mass of neptunium	m_N		
mass of alpha particle	m_{lpha}		
charge of alpha particle	q (positive)		
charge of neptunium	Q (positive		
kinetic energy of neptunium	K_n		
energy of emitted photon	E_x		

1. [10 pts] Write the energy principle equation that you would need to solve to determine the speed of the alpha particle v when it is located at a distance d from the neptunium nucleus. You can treat all speeds as non-relativistic. Your answer should use the variables listed in the table above and any necessary fundamental physical constants. You can neglect all gravitational interactions.

The alpha particle that got emitted in Part 1 travels a very long distance through free space for a very long time, moving with a speed of $v=2.19\times10^7$ m/s. Eventually, it turns out to be in a direct collision course with the nucleus of a gold atom (Figure 1). However, due to the electric repulsion between like charges, the alpha particle never actually touches the gold nucleus. Instead, it gets to a center-to-center distance of $r_{\rm min}$, where it momentarily stops (Figure 2) before it starts moving straight back the way it came.

Alpha	Gold
$m = 6.645 \times 10^{-27} \text{ kg}$	$M = 3.271 \times 10^{-25} \text{ kg}$
$q = +3.200 \times 10^{-19} \text{ C}$	$Q = +1.264 \times 10^{-17} \text{ C}$

2. [20 pts] Use the energy principle to determine what is the distance r_{\min} . You can assume that the gold nucleus never moves, that the alpha particle's speed is non-relativistic, and that the gravitational force between the particles is negligible. All your calculations should keep 3 decimal places.
