Instructions

- This exam is closed internet/books/notes, except for the Formula Sheet which is included with the exam.
- You must work individually and receive no assistance from any person or resource.
- You are not allowed to post screenshots, files, or any other details of the test anywhere online, not even after the test is over.
- Work through all the problems first, then scan/upload your solutions after time is called.
 - Your uploaded files **must** be in either PNG, JPG, or PDF format.
 - Your uploaded files must be readable in order to be graded. Unreadable files will earn a zero.
 - You can upload a single file containing work for multiple problems as long as you upload the file for each problem individually.
 - Clearly label your work for each sub-part and box the final answers.
- To earn partial credit, your work must be legible and the organization must be clear.
 - Your solution should be worked out algebraically.
 - Numerical solutions should only be evaluated at the last step. Incorrect solutions that are not solved algebraically will receive an 80 percent deduction.
 - You must show all work, including correct vector notation.
 - Correct answers without adequate explanation will be counted wrong.
 - Incorrect work or explanations mixed in with correct work will be counted wrong. Cross out anything you do not want us to grade
 - Make explanations correct but brief. You do not need to write a lot of prose.
 - Include diagrams!
 - Show what goes into a calculation, not just the final number, e.g.: $\frac{a \cdot b}{c \cdot d} = \frac{(8 \times 10^{-3})(5 \times 10^6)}{(2 \times 10^{-5})(4 \times 10^4)} = 5 \times 10^4$
 - Give standard SI units with your numeric results. Your symbolic answers should not have units.

Unless specifically asked to derive a result, you may start from the formulas given on the formula sheet, including equations corresponding to the fundamental concepts. If a formula you need is not given, you must derive it.

If you cannot do some portion of a problem, invent a symbol for the quantity you can not calculate (explain that you are doing this), and use it to do the rest of the problem.

"In accordance with the Georgia Tech Honor Code,
I have not given or received unauthorized aid on this test."

Hockey Puck [30 pts]

An ice hockey puck of mass m=170 g enters the goal with a momentum of $\vec{p_i}=<-4.6, 2.9, 0>$ kg m/s, crossing the goal line at location $\vec{r_g}=<-27, 0, 0>$ m relative to the origin which is located in the center of the rink. The puck had been hit by a player 0.4 seconds before reaching the goal.

1. [15 pts] What was the location of the puck $\vec{r_i}$ when it was hit by the player? You can assume negligible friction between the puck and the ice (that is, <u>constant velocity</u>).

$$\vec{f} = \vec{f}_{i} + \vec{v}_{avg} \Delta t
\vec{f}_{i} = \vec{f}_{i} - \vec{v}_{avg} \Delta t
= \vec{f}_{g} - \frac{\vec{f}_{i}}{m} \Delta t
= (-27,0,0) m - 0.4 s
= (-27,0,0) m - 0.17 kg$$

$$\vec{f}_{i} = (-16,18,-6,82,0) m$$

2. [15 pts] The player had hit the puck with a constant force for a very short time $\Delta t = 0.1$ s, which changed only the direction of motion of the puck, not its speed. Before it was hit, the velocity of the puck was along the $+\hat{y}$ axis. What is the force? Your answer must be a vector.

Hint: schematically draw the puck's momentum before and after it is hit by the player.

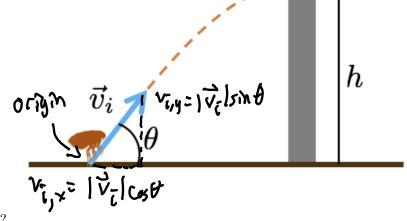

$$\frac{1}{2} \frac{1}{\sqrt{2}} \frac{1}{\sqrt{2}}$$

$$=\frac{0.17kg}{0.15}\left[2-27.06,17.06,0>m15-0.31.99,0>m/s\right]$$

Flea [30 pts] SOLUTION W/OUT KINEMATICS Clook after this solution to, sola w/ kinematics)

Fleas are some of the best jumpers in the Animal Kingdom, relative to body size. A flea with mass m=0.001 g is seen jumping with unknown initial speed $|\vec{v}_i|$ at an angle $\theta=60^\circ$ above the horizontal. At the maximum height of its trajectory, the flea lands on an obstacle that is h=14 cm tall.

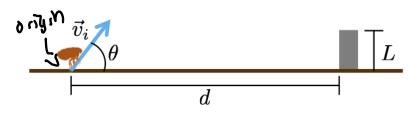

Throughout this problem you should keep 2 decimal places in all calculations. You can assume there is no air resistance.

1. [10 pts] What is the initial speed
$$|\vec{v}_i|$$
 of the flea?

 $\vec{V}_f = \vec{V}_i + \frac{\vec{F}_{ret}}{m} \Delta t$
 $y = \vec{V}_i + \frac{\vec{F}_{ret}}{m} \Delta t$
 $y = \vec{V}_{i,y} + \frac{\vec{F}_{ret,y}}{m} \Delta t$
 $0 = |\vec{V}_i| \sin \theta + \frac{-y \kappa_g}{m} \Delta t$
 $|\vec{V}_i| = \frac{1}{2} |\vec{V}_i| \sin \theta$
 $|\vec{V}_i| = \frac{1}{2} |\vec{V}_i| \sin \theta \Delta t$
 $|\vec{V}_i| = \frac{1}{2} |\vec{V}_i| \sin \theta \Delta t$

2. [20 pts] Our little flea once again jumps in exactly the same way that it did before (i.e., same initial velocity). This time, however, there's a low wall L=3 cm tall at a distance d=31 cm away from the flea. Can the flea fly above this obstacle?

Hint: Find the x and y coordinates of the flea at the position of the obstacle.

At horizontal distance d away from where the flea Jumps, what height (y-pos) is the Flea?

How long does it take the flen to travel a horizontal distance of? Write relocity and position update eq'as in thex.

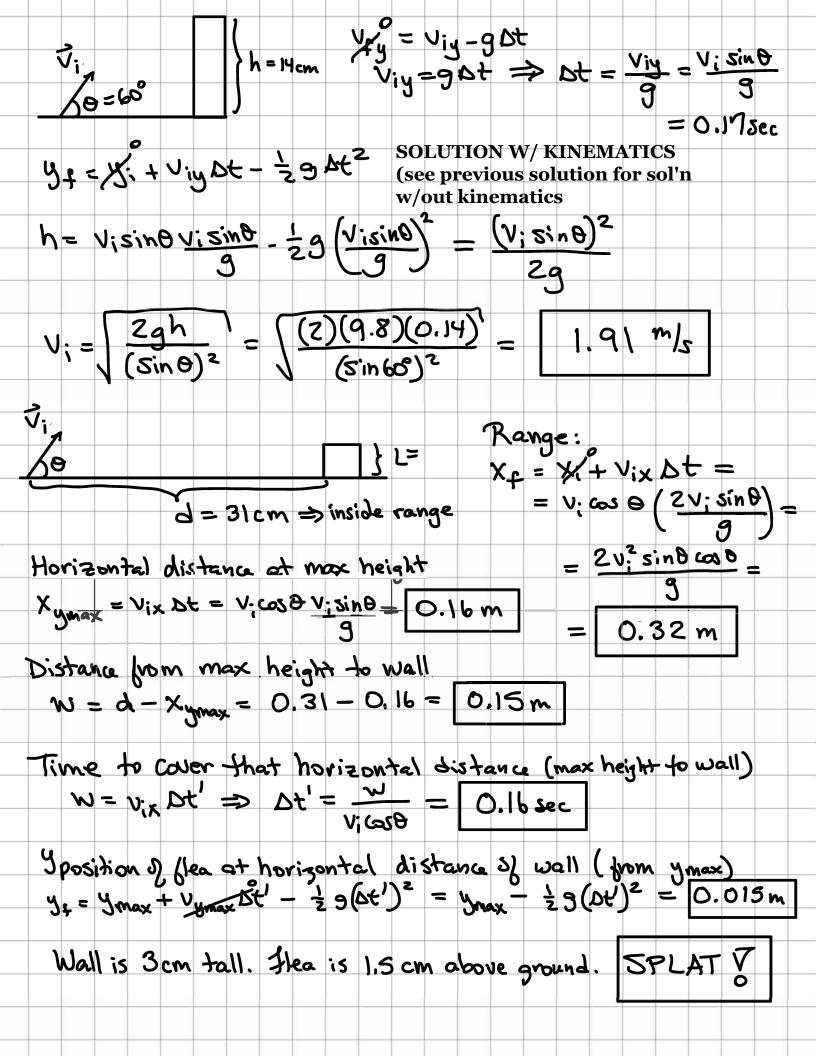

f,x=ri,x+ Varg,x streach wall

=7
$$\Delta t_{real un} = \frac{d}{v_{i,x}} = \frac{d}{|\vec{v}_{i}| \cos t}$$

What is the Hen's height (y-pos) at this time? Fry = Fry + Vargyy Streak wall Vary 1 = = = = (Vc, y + Vx, y) VF,y=Vi,y+ Fret,y streak wall

= [Vi]sin+ -my streak wall

= [Vi]sin+ + my streak wall Vary, $y = \frac{1}{2} \left[2 \left[v_{i} \right] \sin \theta - g \Delta t_{reach wall} \right]$ fry=0+[livelsind~ gstreach wall] Streach wall [Vilsin & Street unit = 1 Vélsin + Tixicos + - 9 (1 Véleos t) formula = 0.62m < L=0.03m No, the Hea will not fly over the wall.

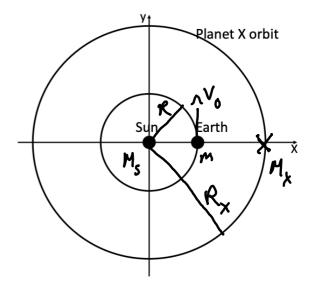

Planet X [40 pts]

We investigate what would be the (tiny) gravitational influence of an elusive 9th planet (Planet X) on the circular motion of the Earth around the Sun. Planet X is believed to make one full orbit around the Sun in 400 Earth years.

The mass of the Sun is M_S , the mass of Planet X is M_X , and the mass of Earth is m. The radius of Earth's orbit is R, and the radius of Planet X's orbit is R_X .

The diagram on the right shows the positions of the Sun and the Earth at time t = 0.

- 1. [5 pts] At t = 0, where does Planet X have to be in its own orbit such that its gravitational influence on Earth is at its strongest value? Mark this position in the diagram with an \mathbf{X} .
- 2. [20 pts] Starting from the positions of the Sun, Earth, and Planet X at t=0, determine the new position of the Earth a short time Δt later. The Earth was already moving counterclockwise with speed v_0 . You can assume Planet X has not moved.

$$\frac{1}{\text{Frot, on Earlh}} = \frac{1}{\text{graw, sun on Earlh}} + \frac{1}{\text{graw, xon Farlh}}$$
